Senior Fullstack Engineer (TypeScript) | Northbeam

Cover letter

Hi Northbeam team,

I call myself a technomancer. I've been drawn to the moment when a system that feels complicated on the inside starts to feel straightforward to the person using it. The Northbeam dashboard looks like that kind of work.

A person comparing attribution windows or looking at campaign performance is trying to decide where to spend money next. I'm interested in how your engineers work with product, customer success and customers to figure out what that person needs to see, what assumptions the interface needs to make clear, and where it can get out of the way.

I worked on a related problem at NuPrice, a long-term client engagement that began while I was at FRII. I built and operated the reseller application, bringing marketplace and competitor data into pricing rules customers could define for themselves. Automated decisions, monitoring and analytics were part of the same product as accounts, subscriptions and support. Handling billing and customer support alongside the application gave me a direct view of what merchants could understand on their own and what they needed help with.

Proofmark is an example of how I work across a TypeScript stack. I completed a client contribution spanning the React and Next.js interface, tRPC APIs and PostgreSQL-backed workflows. Preparing documents, handling identity and moving an agreement through signing had to fit together with audit history and verification. Making those states and fallback paths explicit was as much a product decision as an engineering one.

I'm comfortable taking a feature from a conversation through deployment and staying with it when it needs attention in production. My SQL experience is grounded in application systems and PostgreSQL. I'd bring that foundation and my experience with data-driven client products to learning Northbeam's BigQuery workflows and contributing across the dashboard stack.

I'm based in Colorado and would like to talk about what your team is working on next.

Chad
